Moyasar Platform API

Moyasar Platform API allows trusted partners to create and activate new merchants within the Moyasar Payment Gateway without the need for human interaction.

Versions

- 1.0: Initial Version
- 2.0: Simplified On-Boarding Process
  - Removed `check` from merchant
  - Added `reasons` to indicate the rejection reasons.
  - Added Transfers endpoint to the postman collection
  - Added Balance to the postman collection
  - Added `balance_transferred` webhook event to entity.
  - Added `balance_transferred` webhook event to platform.
  - Removed `merchant_balance_transferred` and `platform_balance_transferred` from webhook events for platform.
- 3.0: Nafath Signing

Terminology

Platform

A platform is Moyasar partner that has access to the API and can register merchants.

Merchant

A merchant is a client for the Platform.

Entity

Each merchant has an associated entity, and in turn each entity has a Live Account and a Test Account.

For simplicity, merchant = entity and entity - merchant.

Live Account

A live account is the account used for actual (real) transactions.

API keys for the live account start with `pk_live_` and `sk_live`.

Test Account

A test account is the account used for test transactions and no charges are made to any account.

API keys for the live account start with `pk_test_` and `sk_test`.

Document

A document is a legal file or identification used to support the merchant during checks.

Expectations

Moyasar expects the platform to do its due diligence and ensure a merchant is eligible for the service before creating submitting any document to Moyasar.

To ensure quick and easy on-boarding process, you are required to upload all required information, too many bad merchants can result in delays in checks and response.

Create a Merchant

To create (register) a merchant within the Moyasar Payment Gateway you need to provide the following information through the platform API:

Field	Description	Required?	Possible Values
type	Type of the Merchant.	✅	freelancer, establishment, company, foreign_company
admin_email	Administrator email that will be automatically invited to access https://dashboard.moyasar.com.	✅	A valid email address
owners_count	The number of owners as appears in the Commercial Registration. This will be used to determine the number of required Owner ID (national ID or Iqama) and the required number of National Addresses.	✅	Interger greater than or equal to 1
signatory	The authorized signatory type, this is required to determine who is authorized to sign the contract.	✅	owner, commercial_contrac power_of_attorney

Field	Description	Required?	Possible Values
signatory_count	The number of people authorized to sign, only needed when signatory is `commercial_contract` or `power_of_attorney`.	✳️	Interger greater than or equal to 1
activity_license_required	An indication of if a special license is required to operate the business (dictated by Commercial Registration).	✅	true or false
name	Machine friendly merchant name, for internal uses only.	✅	Alpha-Numeric and Underscores
public_name	Human friendly name used in display.	✅	Any Text
country	Merchant country, e.g. "SA".	✅	ISO-3166 alpha 2 code.
time_zone	A valid timezone identifier, e.g. Asia/Riyadh.	✅	Valid timezone identifier.
website	The merchants website.	✅	URL
email	The merchants email (info or support).	✅	Email
enabled_schemes	A list of enabled payment schemes, i.e. MADA, Visa, or MasterCard.	✅	Array (list) with a combination of mada, visa and/or master.

Field	Description	Required?	Possible Values
fees	Fee matrix for this client, please see the following table.	✅	Object (Hash).

Fee Matrix Definition

This is how you will define fees for your merchants.

Field	Description	Example
tax_inclusive	Indicate if fees are tax inclusive.	true
mada_charge_rate	Fee rate (percentage) for Mada transactions.	1.70
mada_charge_fixed	Fixed fee for Mada transactions.	1.00
mada_refund_rate	Refund rate (percentage) for Mada transactions.	0.00
mada_refund_fixed	Fixed refund fee (percentage) for Mada transactions.	1.00
cc_charge_rate	Fee rate (percentage) for Credit Card transactions.	2.70
cc_charge_fixed	Fixed fee for Credit Card transactions.	1.00
cc_refund_rate	Refund rate (percentage) for Credit Card transactions.	0.00

Field	Description	Example
cc_refund_fixed	Fixed refund fee (percentage) for Credit Card transactions.	1.00

Fee Calculation

Let us take an example of SAR148.00 and see how fees are calculated for credit card according to the table above:

- Calculate: 148.00 * (2.7 / 100) = 3.996
- We will do a Half-Up Rounding and get 4.00
- Now we add the fixed fee of SAR1.00 and get 5.00
- If tax_inclusive is true, then we are done and our final fee is SAR5.00
- If tax_inclusive is false, then we need to get our tax by 5.00 * (15 / 100) = 0.75 and a final fee of 5.75

Provide Merchant Docs

Depending on the merchant type, the system will need to do farious checks to finalize the on-baording process, each check has a set of required documents. Please make a test to the system and see what checks are required with every merchant type.

You can learn more about checks in the Checks document.

Update Merchant Info

Note: please checkout the Postman collection for more info.

To update a merchants info make a `put` request with the information you need updated.

Here is an example where we update the `name` and `public_name` fields for a merchant:

```
PUT /v1/merchants/88df1418-0290-4563-95c9-4a48eb03987a HTTP/1.1
Host: apimig.moyasar.com
Authorization: Basic <your_api_key_as_basic_base64>
Content-Type: application/json

{
    "name": "Dutch LLC.",
    "public_name": "Happy Bee"
}
```

Update Merchant Fees

Fees can be updated using the same merchant update endpoint:

```
PUT /v1/merchants/88df1418-0290-4563-95c9-4a48eb03987a HTTP/1.1
Host: apimig.moyasar.com
Authorization: Basic <your_api_key_as_basic_base64>
Content-Type: application/json

{
    "fees": {
        "tax_inclusive": true,
        "mada_charge_rate": 1.7,
        "mada_charge_fixed": 1.0,
        "mada_refund_rate": 0.0,
        "mada_refund_fixed": 1.0,
        "cc_charge_rate": 2.7,
        "cc_charge_fixed": 1.0,
```

```
        "cc_refund_rate": 0.0,
        "cc_refund_fixed": 1.0
    }
}
```

Update Merchant Documents

When a merchant is created, you MUST check the `required_documents` key to determine what documents need to be uploaded. To upload a document, you need to provide some info and the supporting file. Here is an example of the Bank IBAN:

```
POST /v1/merchants/88df1418-0290-4563-95c9-4a48eb03987a/documents HTTP/1.1
Host: apimig.moyasar.com
Authorization: Basic <your_api_key_as_basic_base64>
Content-Type: application/json
Content-Length: 200

{
    "type": "bank_iban_certificate",
    "info": {
        "holder": "Dutch van der Linde",
        "iban": "SA9880000000000000012345"
    },
    "file": "data:text/plain;base64,SGlpaWkg8J+RiyE="
}
```

Each document has different `info` required, you can learn more here at Documents.

Missing Documents Status

When the on-boarding team at Moyasar find an issue with the merchants documents or information during the auditing process they will switch the merchant status to `missing_docs`.

In this status, you are required to update or provide missing information by deleting old files and providing new ones and updating the merchant information when required.

When fetching the merchant information through the API, a key named `reasons` will hold one or more of the pre-defined reasons found in "**rejection-reasons**" document.

Merchant Rejection

When a merchant is deemed un-fit for the service, Moyasar will disable payment processing and set the status to rejected.

When fetching the merchant information through the API, a key named `reasons` will hold one or more of the pre-defined reasons found in "**rejection-reasons**" document.

Merchant Hold

Moyasar can stop transfers at any time for a particular merchant by setting the status to `hold`.

Merchant transfers are usually held due to an on-going fraud investigation or a chargeback claim.

Deactivate a Merchant

To be added soon.

Register Apple Pay Domains

To automatically activate Apple Pay, Moyasar has partnered with Apple to provide the easy to use Web Registration API. You can register a domain and activate it through the Platform API.

You can learn more by checking out the attached Postman collection.

Please note that you need to upload the association file (found it `/v1/merchants/:merchant_id/domains/verification_file`) to the merchant website it:

```
https://example-merchant-shop.com/.well-known/apple-developer-merchantid-domain-association
```

Please note that there is no `.txt` extension at the end of the URL.

Also note that the file is the same for all merchant at the moment.
